

AI Social Media Manager – Product Reality Document

Original Vision

Ek AI-powered social media manager / digital marketing agent jo: product ka description le, product ki photos/videos le, brand ka tone aur target audience le, phir automatically: captions banaye, scripts banaye, marketing videos banaye, multiple social platforms ke liye creatives banaye, schedule/post kare, analytics track kare, bataye kaunsa ad ya video chal raha hai aur kaunsa nahi. Simple words me: tum ek aisa AI social media manager banana chahte the jo almost ek mini marketing team ki tarah kaam kare.

Current Reality (What You Actually Built)

Ye ab ek AI marketing MVP / social content operations app jaisa ban gaya hai. Isme: brand management hai, product management hai, product media upload hai, text content generation hai, video strategy/project generation hai, rendered video preview/export pipeline hai, scheduling flow hai, analytics basics hai, multi-variant campaign testing ki direction hai. Lekin exact truth ye hai: kuch jagah real feature hai, kuch jagah mock/MVP behavior hai, kuch jagah naming aur flow confusing hai.

Core Product Flow

Products → Videos → Generate → Schedule → Analytics
Products = input Videos = creative engine
Generate = supporting copy engine
Schedule = publishing
Analytics = performance
Dashboard = overview

Page-wise Breakdown

Page	Real Kya Hai	MVP / Partial Kya Hai	Mock / Fallback	Confusion
Dashboard	Overview, summary	Insights limited	No direct mock	Operational vs analytics unclear
Generate	Captions, scripts, hashtags	Text-only tool	Mock if no API key	Lagta video generate hoga
Videos	Storyboard, project flow	Template/MVP output	Mock fallback	Core feature under-highlighted
Products	Create/edit, upload media	UX improve needed	Local fallback	AI usage unclear
Schedule	Scheduling structure	Partial automation	Integration limits	Full automation expectation
Analytics	Summary, performance base	Deep analytics missing	Simplified data	Ad manager expectation
Settings	Config UI	Manual setup	Partial integration	Plug-and-play assumption

Biggest Problems

1. Naming issue (Generate misleading, Videos under-emphasized) 2. Flow issue (User journey unclear) 3. Product feeling issue (Tools collection vs AI manager)

Ideal User Flow

1. Products → Add product + media 2. Videos → Generate AI video creatives 3. Generate → Create captions/scripts 4. Schedule → Post content 5. Analytics → Learn & optimize 6. Dashboard → Overview

Final Summary

Product direction sahi hai Execution MVP level hai Main problem UX aur positioning hai
